⁽a) Average annual yields are based on the number of dairy cows which were in milk at any part of the year. Averages are, therefore, lower than for cows which were yielding during the greater part of the year. The figures given should be treated as an index rather than an actual average quantity of milk produced per dairy cow.
(b) At 31st December.

SUMMARY OF METEOROLOGICAL CONDITIONS, TASMANIA, 1958.

The year opened with dry conditions throughout the State though some relief was brought by rains on 18–19th February. General dryness continued into March but timely falls at the end of the month were of great benefit to the apple crop. By April, the dry summer—autumn period was being compared with the 1914 drought in the North-west. However, May was very wet and all drought fears were quickly dispelled. Monthly totals were records at many Stations. Comparatively dry and settled weather followed until August when drenching rains again established records, especially over the East Coast. After the most summer-like November for years, December yielded above average rainfall generally.

The only hot spell of the summer was on the 25th-26th February. After a fairly normal March, April days were warm, 3 days over 80° being recorded in Hobart. There were heavy frosts in the last week. The mildest spell of the winter occurred during the first four days of June when many Stations recorded temperatures in the sixties. A reading of 68.2 in Hobart was the highest in June since 1907. Spring weather was changeable; a cold October was sandwiched between two pleasant months. November produced long periods of settled and sunny weather. In December, the only days on which 80°F, was reached were the 8th and 9th; it was a cool month.

May, August and October were noteworthy months of flooding. The Pieman River was most affected in May, the Derwent in August and the South Esk in October. Flooding was the worst in the Derwent since June, 1952 and in the South Esk since May, 1956.

In May, gales were frequent in the last fortnight and the wind travel in Hobart was a record. Several tornadic squalls occurred in the North. Another notable windy period was at the end of March when Hobart registered 79 m.p.h. as a record. Gales also were pronounced in June and August.

The year did not produce exceptional snow falls, though on two occasions (August and October) snow fell in Hobart. Heavy falls developed at the end of August, and again in October during the third week. The most spectacular fall was in mid June when a brief storm deposited snow over all the Eastern Highlands. The low country on the West Coast also was well covered in this storm.

⁽a) Mean monthly temperatures are calculated from the formula $\frac{1}{2}$ (Maximum + Minimum). Averages given are based on the 30-year period 1920-49. The minimum temperatures used are measured over either the 24-hour period ending 9 am., or the 18-hour period ending 9 a.m.
